Req#1:

Sardine helps neo banks and crypto wallets with fraud indemfiication and advanced risk scoring. We're rapidly growing but still a small team. You will be working on design, building, and maintaining APIs, services, and systems across the engineering team. This will include building new features on a large scale, improving internal tooling and process, working on the product and technical roadmaps, and wearing multiple hats internally.

The ideal backend candidate would have experienced building highly available APIs that operate at a non-trivial scale. Experience with data pipelines and relevant domain would be great.

You will

Design, build, and maintain scalable, reliable and performant services and systems
Design, build, manage and operate the infrastructure and configuration with a focus on automation and infrastructure as code.
Build and launch new capabilities and products that bring significant value to customers
Work closely with different engineering teams and product teams.
Work with production systems and on-call process.
Help shape our company's engineering culture and keep high engineering standards
We're looking for someone who has:

5+ years writing production back-end systems code
Experience in successful delivery of high quality production services and systems
An ability to quickly grasp many different services and processes, and the knowledge of when and how to leverage them
Empathy with their users and a strong customer focus
Experience with GCP is a plus
Technologies we use includes:

bigtable
postgres
GCP dataflow (apache beam)
bigquery
ElasticSearch
Metabase
TypeScript (React + node)
Golang
Python
Ruby
Terraform
